

ERAY ÖZ

ABOUT ME

I am a Software Developer who builds modern applications centered around intelligent and robust backends. I am actively working with current AI technologies. My recent projects focus on integrating AI agents and RAG architectures into practical, real-world applications. My main objective is to design systems that do not just use AI as a simple add-on, but leverage it at the core level to automate workflows, process dynamic information efficiently, and deliver smart software solutions.

EDUCATION

B.S. in Computer Engineering
Bülent Ecevit University
2020 - 2026

SKILLS

AI & RAG Architectures
Backend Engineering
Mobile & Frontend

LANGUAGE

- English B2

PROJECTS

Sub-Tracker

- Developed with React Native and Expo, this offline-first mobile application allows users to easily track subscriptions and recurring payments in one place. By integrating a notification infrastructure and iOS/Android widgets, it enables real-time monitoring of upcoming transactions directly from the home screen, significantly enhancing payment visibility and user experience.

Local AI Assistant

- Developed with Next.js, Python, and Ollama, this personal AI assistant unifies WhatsApp, emails, and notes into a single chat interface. Running entirely on local models via a custom RAG pipeline, it ensures zero data leaves the device, allowing secure, offline natural language querying across all personal data.

NoteBrain

- Built with React Native and Supabase, NoteBrain is a social AI platform unifying multi-format content (PDFs, YouTube, URLs). Utilizing a Gemini-powered RAG architecture for smart chat and summarization, its backend is highly optimized for scalability, delivering a fast, collaborative environment for knowledge sharing and discovery.

Ticket System

- Built an experimental NestJS backend to benchmark high-traffic scalability. Integrating Redis for atomic stock management and BullMQ for async queueing eliminated database bottlenecks. Validated via k6 load tests, the optimized architecture achieved 270% higher throughput and 75% lower latency compared to traditional setups.
